The Diagnostic Standards of Care series presents common errors associated with diagnoses in clinical pathology, using case examples to illustrate effective analysis based on current evidence and standards. Each volume demonstrates the use of quality assurance and the role of the pathologist in ensuring quality and patient safety. Hematology and Immunology focuses on core issues in achieving quality in all areas of hematopathology and immunology, with an emphasis on identifying established, evidence-based standards. It addresses potential problems and sources of error in testing procedures, how to anticipate and avoid such problems, and how to manage them if they occur. Discussions are problem-based and address common situations and issues faced by clinical pathologists or members of a laboratory team. Using actual case studies, the book provides plentiful examples of errors, along with discussions on how to deal with them effectively.

Hematology and Immunology Features Key issues in achieving quality in all areas of hematology and immunology Numerous case examples offering real-world illustrations of how problems occur and how to avoid them An

emphasis on identifying established, evidence-based standards in hematology and immunology. This book reviews the molecular genetics of the thalassemia syndromes, inherited hemoglobin disorders that comprise the commonest monogenic disorders globally. Thalassemias are found in high frequencies in tropical regions corresponding to the malaria belt. Beta thalassemia traits show high HbA₂ by HPLC, and β -globin mutations (commonly point mutations) are detected by using ARMS-PCR, reverse dot-blot analysis and β -globin gene sequencing. Globally >300 globin gene mutations exist, however regional mutations are limited to 5-6 common ones. Alpha globin gene defects can only be identified by molecular tests, the exception being HbH disease that shows "golf ball" appearance in HbH preparation, pre-integration peaks on HPLC and a fast-moving band on hemoglobin electrophoresis. Multiplex Gap-PCR identifies common α -globin gene deletions. Specific PCR across the junction caused by the unequal crossing over can detect α -gene triplication. However, heterozygosity or homozygous triplication cannot be resolved by this technique. Non-deletional α -thalassemia can be characterized by specific α -globin gene sequencing. Identification of unusual deletions requires Multiplex Ligation-dependent Probe Amplification. In conclusion, the molecular characterization of human globin gene disorders is required to resolve the phenotypically heterogeneous thalassemia syndromes. Molecular analysis is also an important tool to prevent these disorders by offering prenatal screening in regions with a high disease burden.

Haematology Nursing is a comprehensive handbook, with a nursing focus, on the care and management of patients with haematological disorders. Divided into four sections, the first provides an introduction to haematology, looking at haemopoiesis, immunology and genetics. Section Two covers non-malignant haematology, including anaemia, haemoglobinopathies and haemochromatosis. Section Three explores the pathophysiology, care and management of

myeloproliferative and lymphoproliferative disorders, including leukaemia, myeloma, and lymphoma. The final section provides information on various nursing care interventions, including blood transfusion, venous access devices, and palliative care. Aimed principally at nurses working in a variety of settings including haematology/oncology wards, medical/haematology wards, specialist bone marrow transplant centres, and community settings, Haematology Nursing is an essential and much-needed reference guide. This book provides a thorough update on the management of infections in patients with hematologic malignancies, focusing particularly on prevention, diagnosis, and treatment. Detailed attention is devoted to the central roles that vaccination and anti-infective prophylaxis have gained in improving overall survival in this patient group, in accordance with the principle that prevention is better than cure. Careful consideration is also paid to risk stratification, which is crucial in ensuring that anti-infective prophylaxis is targeted to those at the highest risk. While preventive strategies reduce the prevalence of infections, optimized management strategies are vital to decrease infection-related morbidity and mortality in those who nevertheless develop infections. Here, readers will find in-depth, up-to-date knowledge on the diagnosis and treatment of bacterial, fungal, viral, and parasitic infections, according to the affected organ and the causative pathogen. Finally, treatment in intensive care units is reviewed. The book will be of high value for hematologists, oncologists, and infection specialists. Less than one percent of the National Cancer Institute's budget is spent on any aspect of palliative care research or education, despite the half million people who die of cancer each year and the larger number living with cancer and its symptoms. Improving Palliative Care for Cancer examines the barriers â € "scientific, policy, and social â € "that keep those in need from getting good palliative care. It goes on to recommend public- and private-sector actions that would lead to the development of more effective palliative interventions; better information about currently used interventions; and greater knowledge about, and access to, palliative care for all those with cancer who would benefit from it.
