These include fractional snow cover change in the Himalayan region, and the impact of frequent cyclonic storms on land use and land cover changes along coastal areas. The book explores watershed, surface water, and hydrologic conditions for urban storm water drainage, as well as trend analysis of precipitation, and a statistical approach to detect rainfall trends. The book starts with a critical review of climate change diplomacy, adaptation and mitigation strategies in South Asian countries. It also covers the role of natural gas in energy security. There are chapters pertaining to farmer's perception on the impact of climate change, as well discussion on land use change and ecological implications. Many geographical areas are covered including; the Mahananda River Basin, Pindar Basin, Kumaun Himalaya, the Upper Tapi River Basin, Southern Kerala Districts, Uttar Pradesh, Karnataka State, Telangana

State, Tamil Nadu State, to name a few. This Special Issue is a platform to fill the gaps in drought risk analysis with field experience and expertise. It covers (1) robust index development for effective drought monitoring; (2) risk analysis framework development and early warning systems; (3) impact investigations on hydrological and agricultural sectors; (4) environmental change impact analyses. The articles in the Special Issue cover a wide geographic range, across China, Taiwan, Korea, and the Indo-China peninsula, which covers many contrasting climate conditions. Hence, the results have global implications: the data, analysis/modeling, methodologies, and conclusions lay a solid foundation for enhancing our scientific knowledge of drought mechanisms and relationships to various environmental conditions. This paper begins by presenting the moving average methodology of detecting the direction of a trend and identifying turning points in the trend in real time. The paper then proceeds to introduce the

general weighted moving average, derives some of its key properties, and discusses how to quantitatively assess the two important characteristics of a moving average: the average lag time and the smoothness. Finally the paper aims to give an overview of some specific types of moving averages used in market timing. These types include regular moving averages, moving averages of moving averages, and mixed moving averages with less lag time. Different types of moving averages are compared to each other with respect to their smoothness and lag time. The paper argues that the notion of the "lag time" of a moving average is an elusive concept. The analysis provided in this paper suggests that there are two issues with the quantity known as the "average lag time" of a moving average. First, the average lag time has little to do with the delay in the identification of turning points in a trend. Second, the average lag time can be easily manipulated. For example, the average lag time can be reduced to zero by worsening the tradeoff between the smoothness of a

moving average and its delay in turning point identification. Introduction The dramatic increase in available computer storage capacity over the last 10 years has led to the creation of very large databases of scientific and commercial information. The need to analyze these masses of data has led to the evolution of the new field knowledge discovery in databases (KDD) at the intersection of machine learning, statistics and database technology. Being interdisciplinary by nature, the field offers the opportunity to combine the expertise of different fields into a common objective. Moreover, within each field diverse methods have been developed and justified with respect to different quality criteria. We have to investigate how these methods can contribute to solving the problem of KDD. Traditionally, KDD was seeking to find global models for the data that - plain most of the instances of the database and describe the general structure of the

data. Examples are statistical time series models, cluster models, logic programs with high coverage or classification models like decision trees or linear decision functions. In practice, though, the use of these models often is very limited, because global models tend to find only the obvious patterns in the data, which domain experts already are aware of. What is really of interest to the users are the local patterns that deviate from the already-known background knowledge. David Hand, who organized a workshop in 2002, proposed the new field of local patterns. Published in association with The Wildlife Society.
